Chapter 5

datasets

5.1 make_blobs

5.2 make_friedman1

`make_friedman1(n_samples=100, n_features=10, *, noise=0.0, random_state=None)`

Inputs `X` are independent features uniformly distributed on the interval $[0,1]$. The output `y` is created according to the formula:

$$y = 10\sin(\pi x_1 x_2) + 20(x_3 - \frac{1}{2})^2 + 10x_4 + 5x_5 + \textit{Gaussian Noise}(0,\sigma) \tag{5.1}$$

A synthetic data set called *Friedman-1*, originally created by Jerome Friedman in 1991 to explore how well his new multivariate adaptive regression splines (MARS) algorithm was fitting high-dimensional data.

This data set was carefully generated to evaluate a regression method's ability to only pick up true feature dependencies in the data set and ignore others.

Table 5.2: make_friedman1主要参数

Properties	Names	Descriptions
Parameters	`n_samples: int, default=100`	The number of samples.
Parameters	`n_features: int, default=10`	The number of features. Should be at least 5.
Parameters	`noise: float, default=0.0`	The standard deviation of the gaussian noise applied to the output.
Returns	`X: ndarray of shape (n_samples, n_features)`	The input samples.
Returns	`y: ndarray of shape (n_samples,)`	The output values.
